

CLINSIM

SIMULATION OF CLINICAL STUDIES

Basing on complex patient behavior, all influencing factors of clinical study are mapped. The main attention is turned to the underlying supply chain which contains all steps from production to the patient. The strategies used for orders can be freely parameterized and mapped. After the simulation model has been setup, the course of the clinical study is simulated. Subsequently all results and parameters are on call and can be represented in the form of reports and graphics. Thus, it is possible to try out various scenarios in order to achieve a starting situation which is as ideal as possible for the real study.

Easy-to-apply software

Your benefits

- Simulation of the clinical study
- Calculation of a preview
- Testing of different strategies
- Access to all important parameters
- Presentation of the result
- Generic parameterisation of the supply chain (patients, ...)
- Generic parameterisation of the patient behavior

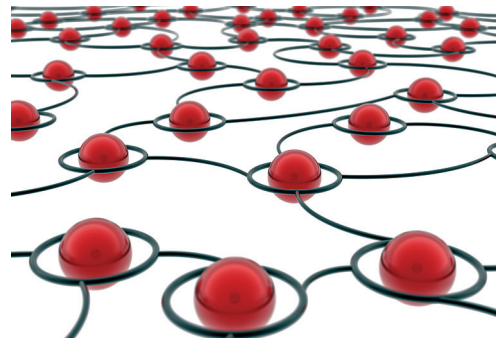

Versatility of the different drugs

Our services for you

- Preparation of tailor-made solution with visualization and statistic evaluation of the simulated study

Target group

- Pharmaceuticals companies
- Logistics companies

Complex structure of a supply chain
